AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1	1. (Currently amended) A method for reducing the overhead involved
2	in executing native code methods in an application running on a virtual machine,
3	comprising:
4	selecting a call to any native code method to be optimized within the
5	virtual machine;
6	decompiling at least part of the selected native code method into an
7	intermediate representation, wherein an intermediate representation includes a set
8	of instruction code which is not in final executable form;
9	obtaining an intermediate representation associated with the application
10	running on the virtual machine which interacts with the selected native code
11	method;
12	integrating the intermediate representation for the selected native code
13	method into the intermediate representation associated with the application
14	running on the virtual machine to form an integrated intermediate representation;
15	and
16	generating native code from the integrated intermediate representation,
17	wherein the native code generation process optimizes interactions between the
18	application running on the virtual machine and the selected native code method,
19	wherein optimizing the interactions involves optimizing calls from the application
20	to the selected native code method by using additional information from the
21	integrated intermediate representation to reduce the number of indirect calls and

- indirect references associated with the calls from the application to the selected native code method.
- 1 2. (Currently amended) The method of claim 1, wherein selecting the call to the to any native code method involves selecting the call based upon at least one of:
- 4 the execution frequency of the call; and
- the overhead involved in performing the call to the <u>selected</u> native code method as compared against the amount of work performed by the <u>selected</u> native code method.
- 1 3 (Canceled).

1

- 4. (Currently amended) The method of claim 1, wherein optimizing interactions between the application running on the virtual machine and the selected native code method involves optimizing callbacks by the selected native code method into the virtual machine.
- 5. (Currently amended) The method of claim 4, wherein optimizing callbacks by the <u>selected</u> native code method into the virtual machine involves optimizing callbacks that access heap objects within the virtual machine.
 - 6. (Currently amended) The method of claim 4, wherein the virtual machine is a platform-independent virtual machine; and
- wherein combining integrating the intermediate representation for the

 selected native code method with the intermediate representation associated with

 the application running on the virtual machine involves integrating calls provided

 by an interface for accessing native code into the selected native code method.

1	(Original) The method of claim 1, wherein obtaining the
2	intermediate representation associated with the application running on the virtua
3	machine involves recompiling a corresponding portion of the application.
1	8. (Original) The method of claim 1, wherein obtaining the
2	intermediate representation associated the application running on the virtual
3	machine involves accessing a previously generated intermediate representation
4	associated with the application running on the virtual machine.
1	0 (Cumontly amonded) The mathed of claim 1 wherein mion to
1	9. (Currently amended) The method of claim 1, wherein prior to
2	decompiling the <u>selected</u> native code method, the method further comprises
3	setting up a context for the decompilation by:
4	determining a signature of the call to the selected native code method; an
5	determining a mapping from arguments of the call to corresponding
6	locations in a native application binary interface (ABI).
1	10. (Currently amended) A computer-readable storage device storing
2	instructions that when executed by a computer cause the computer to perform a
3	method for reducing the overhead involved in executing native code methods in
4	an application running on a virtual machine, the method comprising:
5	selecting a call to any native code method to be optimized within the
6	virtual machine;
7	decompiling at least part of the selected native code method into an
8	intermediate representation, wherein an intermediate representation includes a se

of instruction code which is not in final executable form;

10	obtaining an intermediate representation associated with the application
11	running on the virtual machine which interacts with the selected native code
12	method;
13	integrating the intermediate representation for the selected native code
14	method into the intermediate representation associated with the application
15	running on the virtual machine to form an integrated intermediate representation
16	and
17	generating native code from the integrated intermediate representation,
18	wherein the native code generation process optimizes interactions between the

generating native code from the integrated intermediate representation, wherein the native code generation process optimizes interactions between the application running on the virtual machine and the <u>selected</u> native code method, wherein optimizing the interactions involves optimizing calls from the application to the <u>selected</u> native code method by using additional information from the integrated intermediate representation to reduce the number of indirect calls and indirect references associated with the calls <u>from the application to the selected native code method</u>.

- 11. (Currently amended) The computer-readable storage device of claim 10, wherein selecting the call to the to any native code method involves selecting the call based upon at least one of:
- 4 the execution frequency of the call; and
- the overhead involved in performing the call to the <u>selected</u> native code method as compared against the amount of work performed by the <u>selected</u> native code method.
- 1 12 (Canceled).

13. (Currently amended) The computer-readable storage device of claim 10, wherein optimizing interactions between the application running on the

- 3 virtual machine and the <u>selected</u> native code method involves optimizing
- 4 callbacks by the <u>selected</u> native code method into the virtual machine.
- 1 14. (Currently amended) The computer-readable storage device of
- 2 claim 13, wherein optimizing callbacks by the <u>selected</u> native code method into
- 3 the virtual machine involves optimizing callbacks that access heap objects within
- 4 the virtual machine.
- 1 15. (Currently amended) The computer-readable storage device of
- 2 claim 13,
- wherein the virtual machine is a platform-independent virtual machine;
- 4 and
- 5 wherein combining integrting the intermediate representation for the
- 6 <u>selected</u> native code method with the intermediate representation associated with
- 7 the application running on the virtual machine involves integrating calls provided
- 8 by an interface for accessing native code into the <u>selected</u> native code method.
- 1 16. (Previously presented) The computer-readable storage device of
- 2 claim 10, wherein obtaining the intermediate representation associated with the
- 3 application running on the virtual machine involves recompiling a corresponding
- 4 portion of the application.
- 1 17. (Previously presented) The computer-readable storage device of
- 2 claim 10, wherein obtaining the intermediate representation associated with the
- 3 application running on the virtual machine involves accessing a previously
- 4 generated intermediate representation associated with the application running on
- 5 the virtual machine.

1	18. (Currently amended) The computer-readable storage device of
2	claim 10, wherein prior to decompiling the selected native code method, the
3	method further comprises setting up a context for the decompilation by:
4	determining a signature of the call to the selected native code method; and
5	determining a mapping from arguments of the call to corresponding
6	locations in a native application binary interface (ABI).
1	19-27. (Cancelled)
1	28. (Currently amended) A method for reducing the overhead involved
2	in executing native code methods in an application running on a virtual machine,
3	comprising:
4	deciding to optimize a callback by any native code method into the virtual
5	machine;
6	decompiling at least part of the selected native code method into an
7	intermediate representation, wherein an intermediate representation includes a set
8	of instruction code which is not in final executable form;
9	obtaining an intermediate representation associated with the application
10	running on the virtual machine which interacts with the selected native code
11	method;
12	integrating the intermediate representation for the selected native code
13	method into the intermediate representation associated with the application
14	running on the virtual machine to form an integrated intermediate representation;
15	and
16	generating native code from the integrated intermediate representation,
17	wherein the native code generation process optimizes the callback by the by any
18	native code method into the virtual machine, wherein optimizing the interactions
19	callback involves optimizing calls from the application to the selected native code

20	method to the application by using additional information from the integrated
21	intermediate representation to reduce the number of indirect calls and indirect
22	references associated with the calls from the selected native code method to the
23	application.

- 29. (Currently amended) The method of claim 28, wherein the native code generation process also optimizes calls to the <u>selected</u> native code method by the application.
- 1 30. (Currently amended) The method of claim 28, wherein optimizing 2 the callback by the by any native code method into the virtual machine involves optimizing a callback that accesses a heap object within the virtual machine.
- 31. (Currently amended) The method of claim 28,
 wherein the virtual machine is a platform-independent virtual machine;
 and
 wherein combining integrating the intermediate representation for the
 selected native code method with the intermediate representation associated with
- the application running on the virtual machine involves integrating calls provided by an interface for accessing native code into the <u>selected</u> native code method.
 - 32. (Currently amended) A computer-readable storage device storing instructions that when executed by a computer cause the computer to perform a method for reducing the overhead involved in executing native code methods in an application running on a virtual machine, the method comprising:
 - deciding to optimize a callback by any native code method into the virtual machine;

1

2

3

1

2

3

4

decompiling at least part of the selected native code method into an
intermediate representation, wherein an intermediate representation includes a set
of instruction code which is not in final executable form;

obtaining an intermediate representation associated with the application running on the virtual machine which interacts with the <u>selected</u> native code method;

integrating the intermediate representation for the <u>selected</u> native code method into the intermediate representation associated with the application running on the virtual machine to form an integrated intermediate representation; and

generating native code from the combined intermediate representation, wherein the native code generation process optimizes the callback by the by any native code method into the virtual machine, wherein optimizing the interactions callback involves optimizing calls from the application to the selected native code method to the application by using additional information from the integrated intermediate representation to reduce the number of indirect calls and indirect references associated with the calls from the selected native code method to the application.

- 33. (Currently amended) The computer-readable storage device of claim 32, wherein the native code generation process also optimizes calls to the <u>selected</u> native code method by the application.
- 34. (Currently amended) The computer-readable storage device of claim 32, wherein optimizing the callback by the by any native code method into the virtual machine involves optimizing a callback that accesses a heap object within the virtual machine.

- 1 35. (Currently amended) The computer-readable storage device of
- 2 claim 32, wherein the virtual machine is a platform-independent virtual machine;
- 3 and
- 4 wherein combining integrating the intermediate representation for the
- 5 <u>selected</u> native code method with the intermediate representation associated with
- 6 the application running on the virtual machine involves integrating calls provided
- 7 by an interface for accessing native code into the <u>selected</u> native code method.
- 1 36-39. (Canceled)
